

Recruiting Analytics Dashboard

Transforming a manual job-application tracker into an interactive decision-support solution.

Edgar Garcia | Business Analytics & Information Systems

Final Executive Overview

Role	Business Analyst / Power BI Developer / Project Manager
Tools	Power BI, Power Query, DAX, Excel, requirements and process documentation
Baseline	252 cleaned application records; data through June 30, 2026
Deliverables	Interactive PBIX, portfolio PDF, cleaned data, BA artifacts, and case study

Executive Summary

The Recruiting Analytics Dashboard converts a manually maintained application tracker into a four-page reporting solution. It makes pipeline health visible, surfaces aging applications, compares job-search effort across role categories and sources, and provides searchable record-level views of active interviews and application history.

The project was delivered as an end-to-end business analysis case study: stakeholder needs, requirements, data-quality findings, wireframes, Power Query transformations, DAX measures, visual validation, and usage documentation were developed as one connected solution.

Final KPI Snapshot

252	212	4	34	2	1.6%	149
Applications	Pending	Interviews	Rejected	Closed	Interview Rate	Pending >30d

Key Insights

- 212 of 252 records were still marked Pending, while only four active interview opportunities were recorded.
- The overall interview rate was 1.6%, indicating that targeting and conversion quality matter more than raw application volume.
- 149 pending applications were older than 30 days and required follow-up or status review.
- LinkedIn was the leading interview source, and Sales & Business Development was the top role category by interviews.

Business Value

Visibility A single executive view summarizes pipeline outcomes, activity, and aging.	Prioritization Aging bands identify records that need follow-up or closure.
Strategy Category and source comparisons show where effort is concentrated and producing interviews.	Governance Definitions, assumptions, duplicate exclusions, and limitations make the report auditable.

Business Problem and Delivery Approach

The original tracker supported record keeping but did not efficiently answer management-style questions about status totals, aging records, source performance, role-category concentration, or current interview opportunities. The project created a reliable analytical baseline and a repeatable reporting experience.

Project Objectives

- Create a reliable analytical baseline from the existing Excel tracker.
- Standardize status definitions and approved KPI logic.
- Compare application volume and interview outcomes by month, category, and source.
- Provide executive, strategic, and record-level reporting views.
- Document of assumptions, limitations, and responsible usage guidance.
- Deliver a professional portfolio report with supporting BA artifacts.

End-to-End Delivery

1. Foundation	Defined the business need, scope, objectives, success measures, risks, and deliverables.
2. Elicitation	Captured stakeholder pain points, decisions, and reporting priorities.
3. Requirements	Created requirements, user stories, process maps, and approved wireframes.
4. Data Quality	Profiled the tracker, documented gaps, and reviewed probable duplicates.
5. Preparation	Standardized data types and built refresh-based aging logic in Power Query.
6. Modeling	Created KPI, status, rate, aging, and display-label measures in DAX.
7. Visualization	Built four coordinated pages with slicers, navigation, charts, cards, and tables.
8. Validation	Corrected chronology, labels, table usability, and final PDF presentation.

Data Quality and Technical Implementation

Data-Quality Findings

- Three probable duplicates were excluded from the analytical copy, leaving 252 records.
- 43 application-source values remained Unknown and were kept visible rather than imputed.
- Work Type was largely incomplete, so work-arrangement analysis was deferred.
- 21 salary records were missing; hourly and annual salaries were not combined into one average.
- The tracker did not contain follow-up dates, contact history, interview stages, or rejection reasons.

Power Query and Model Preparation

- Connected Power BI to the structured PowerBICleanTable in the cleaned Excel workbook.
- Standardized dates, salary fields, identifiers, and categorical columns to appropriate data types.
- Rebuilt Days Since Applied using refresh-based date logic.
- Created a proper month-start field for chronological reporting and consistent filtering.

Representative DAX

```
Total Applications =  
DISTINCTCOUNT(PowerBICleanTable[Application ID])  
  
Interview Rate =  
DIVIDE([Interview Applications], [Total Applications], 0)  
  
Data Through Label =  
"Data through: " & FORMAT(MAX(PowerBICleanTable[Date Applied]), "MMM d, yyyy")
```

Skills Demonstrated

Business analysis Elicitation, requirements, user stories, process mapping, assumptions, and success measures.	Data analysis Profiling, duplicate review, KPI definition, aging, conversion, and segment comparison.
Power BI Power Query, DAX, slicers, navigation, cards, charts, tables, and export validation.	Project delivery Project index, decision log, action tracking, QA, documentation, and final packaging.

Dashboard Walkthrough

1. Executive Overview

The Executive Overview presents pipeline health at a glance. Four slicers support filtering by month, status, role category, and source. The KPI row summarizes outcomes, the timeline shows application activity chronologically, and the bottom cards highlight aging and the strongest interview-producing segments.

Executive Overview: KPIs, application activity, status distribution, and decision-focused insights.

Design Features

- Executive-first hierarchy: slicers, KPIs, trend, status distribution, then action-oriented insights.
- Dynamic data-through label communicates the most recent application date in the model.
- Consistent navigation and active-page highlighting make the four-page report easy to explore.
- Chronological month-start logic prevents misleading text-based month sorting.

Dashboard Walkthrough (continued)

2. Performance & Strategy

The strategy page compares application concentration by role category and source, segments pending records into aging bands, and compares interview rates across categories with recorded interviews. It helps determine where future effort should be focused.

Performance & Strategy: category/source concentration, pending aging, and interview-rate comparison.

Decision Support

- Application-volume charts show where effort has been concentrated.
- Aging cards separate recent pending records from records that may require follow-up or closure.
- Interview-rate comparison shifts the discussion from activity volume to conversion quality.
- Top-category and top-source cards summarize the current strongest segments under selected filters.

Dashboard Walkthrough (continued)

3. Application Details - Privacy-Safe Public View

The production report includes searchable record-level views of active interviews and application history. The public case study intentionally withholds company names, job titles, application dates, locations, notes, and other personal job-search details.

Application Details

Public portfolio version - synthetic records only

Status

Withheld

Role Category

Withheld

Source

Withheld

Company

Withheld

4

Aggregate interviews

Record-level fields withheld

Company, job title, dates, locations, notes, and aging values are not published.

Company	Job Title	Applied	Status
Example Company A	Business Systems Analyst	May 12	Interview
Example Company B	Data Analyst	May 26	Pending

Synthetic demonstration only. No original application records are shown.

Operational Features

- Current-interview KPI and filtered detail view support daily follow-up prioritization.
- Slicers allow users to narrow results by status, role category, source, and company.
- Searchable record-level tables preserve operational usability in the private working report.
- The public release demonstrates structure and logic without exposing personal records.

Dashboard Walkthrough (continued)

4. About & Definitions

The About & Definitions page documents the report purpose, source, refresh process, status and KPI definitions, assumptions, limitations, and usage guidance. This governance layer helps prevent misleading interpretation of incomplete fields or mixed salary types.

About & Definitions: metric logic, limitations, and responsible interpretation guidance.

Governance Features

- Status definitions clarify how Pending, Interview, Rejected, and Role Closed are interpreted.
- KPI definitions explain distinct counts, rates, and aging logic.
- Known limitations preserve transparency around Unknown sources, missing work type, and salary comparability.
- Usage guidance directs reviewers from executive overview to strategy and record-level analysis.

Results and Portfolio Value

Project Outcome

The finished project is more than a visualization. It is a complete analytical deliverable that connects a business problem to requirements, data preparation, model logic, dashboard design, validation, and documentation. The report is interactive, exportable, and organized within Project Atlas as a final portfolio asset.

What the Project Proves

- I can translate stakeholder questions into measurable requirements and report designs.
- I can assess data quality, preserve uncertainty, and document analytical limitations.
- I can use Power Query and DAX to create a repeatable semantic model and KPI layer.
- I can design an executive-to-operational reporting flow rather than a disconnected set of visuals.
- I can validate presentation details such as chronology, labels, spacing, filters, and export quality.
- I can package technical work into a recruiter-friendly case study and portfolio deliverable.

Resume-Ready Project Bullet

Developed a four-page Power BI recruiting analytics dashboard using Power Query and DAX to analyze 252 job applications, track pipeline outcomes, identify aging pending records, and compare performance across role categories and application sources.

Interview Story

Situation	A manual job-application tracker stored useful records but did not support fast analysis or prioritization.
Task	Create a portfolio-quality decision-support tool that answered pipeline, strategy, and record-level questions.
Action	Gathered requirements, assessed data quality, cleaned and modeled the data, built DAX KPIs, designed four pages, and validated the final export.
Result	Delivered an interactive dashboard with 252-record analysis, aging visibility, conversion metrics, source/category comparisons, and documented limitations.

Future Enhancements

- Add follow-up dates, contact history, interview stages, and rejection reasons.
- Create a dedicated date table and additional conversion metrics as the dataset grows.
- Introduce a sanitized public dataset and reusable SQL/Python pipeline in a future version.

Public Repository and Release Package

The project is published as a dedicated GitHub portfolio repository designed for recruiter review while protecting personal job-search information.

Repository

github.com/edgar-garcia26/recruiting-analytics-dashboard

Public Power BI and business-analysis case study with documentation, DAX, screenshots, and synthetic sample data.

Included in the Public Release

- ✓ Executive Overview, Performance & Strategy, and About & Definitions screenshots
- ✓ Privacy-safe dashboard PDF and portfolio case study
- ✓ Methodology, assumptions, limitations, and representative DAX documentation
- ✓ Synthetic sample CSV demonstrating the public schema
- ✓ README navigation that allows non-Power-BI users to review the project quickly

Excluded for Privacy and Security

- Original Excel tracker and cleaned record-level dataset
- Unsanitized Application Details screenshot and personal application history
- Recruiter names, contact details, private notes, and local file paths
- Original PBIX model containing record-level job-search data

Release Rationale

The public package preserves enough evidence to evaluate the analysis process, design quality, KPI logic, documentation, and decision-support value without publishing sensitive operational records. This demonstrates both analytical skill and responsible data handling.

Portfolio review path

Portfolio website → case study / dashboard PDF → GitHub repository

Each step provides deeper evidence while maintaining a privacy-safe public boundary.
